Aperture refers to the opening in a camera lens through which light passes to enter the camera. It is measured in f-stops, such as f/2.8 or f/16, where a lower number indicates a wider opening. A wider aperture allows more light to reach the sensor, making it ideal for low-light conditions.

In addition to controlling light, aperture also affects the depth of field in an image. A wide aperture creates a shallow depth of field, resulting in a blurred background that emphasizes the subject. Conversely, a narrow aperture increases the depth of field, keeping more of the scene in focus.
